## ORGANISER

| Section 1: Chemical calculations Key Terms |  |
| :---: | :---: |
| Law of conservation of mass | No atoms are destroyed or created during a chemical reaction. The total mass of the products is the same as the total mass of the reactants. Some reactions appear to give a change in mass, but this is because a gas may have escaped from the reaction container. |
| Relative atomic mass ( $A_{r}$ ) | The average mass of an atom of an element compared to Carbon-12. |
| Relative formula mass ( $M_{r}$ ) | The sum of all the atomic masses of the atoms in a formula of a substance (e.g. $\mathrm{CO}_{2}$ ). |
| Uncertainty | The interval within which the true value can be expected to lie. E.g. $25^{\circ} \mathrm{C} \pm 2^{\circ} \mathrm{C}$ - the true value lies between $23^{\circ} \mathrm{C}$ and $27^{\circ} \mathrm{C}$. |
| Mole (HT) | A measurement for the amount of a chemical. It is the amount of substance in the relative atomic or formula mass of a substance in grams. The mass (in grams) of $\mathbf{6 . 0 2 \times 1 0 ^ { \mathbf { 2 3 } } \text { (the Avogadro constant) } { } ^ { 2 } \text { ) } { } ^ { 2 } \text { . }}$ atoms of an element. Symbol: mol. |
| Balanced equation (HT) | Balanced symbol equations show the number of moles that react. $\text { e.g. } \mathrm{Ca}+2 \mathrm{HCl} \rightarrow \mathrm{CaCl}_{2}+\mathrm{H}_{2}$ <br> Shows one mole of Calcium reacting with two moles of hydrochloric acid to form one mole of Calcium chloride and one mole of hydrogen. |
| Limiting reactant (HT) | The reactant that gets used up first in a chemical reaction. It limits the amount of product formed. |
| Excess reactant (HT) | The reactant that is not completely used up in a chemical reaction. There is some reactant left at the end. |
| Concentration | A measure of the number of particles of a chemical in a volume. Can be measured in $\mathrm{g} / \mathrm{dm}^{3}$. |
| Decimetre ${ }^{3}\left(\mathrm{dm}^{3}\right)$ | A measurement of volume. Contains $1000 \mathrm{~cm}^{3}$. |

Section 2: Calculating relative formula mass (Mr)
Add up all the atomic masses in a formula.

$$
\begin{gathered}
=16 . \\
12+(2 \times 16)=44
\end{gathered}
$$

## Section 3: Calculating moles and masses (HT)

1) How many moles are there in 9.8 g of sulfuric acid $\mathrm{H}_{2} \mathrm{SO}_{4}$ ?

Number of moles $=\frac{9.8}{98}=0.1$ moles 98
2) What is the mass of 2.5 moles of Carbon dioxide?

Mass $=2.5 \times 44=88 \mathrm{~g}$

## Section 4: Equations and calculations (HT)

1) What masses of reactants and products are involved in the balanced symbol equation $\mathrm{H}_{2}+\mathrm{Cl}_{2} \rightarrow 2 \mathrm{HCl}$

Reactants: $(2 \times 1)+(2 \times 35.5)=73$
Products: $2 \times 36.5=73$
Number of moles $=\underline{\text { mass }(g)}$
$M_{r}$
2) What mass of oxygen will react with 72.0 g of magnesium?

$$
2 \mathrm{Mg}+\mathrm{O}_{2} \rightarrow 2 \mathrm{MgO}
$$

Moles $\mathrm{Mg}=\mathbf{7 2 / 1 2}=\mathbf{3}$ moles Molar ratio Mg: $\mathrm{O}_{2}$ is $\mathbf{2 : 1}$
Moles $\mathrm{O}_{2}=3 / 2=1.5$ moles
Mass $\mathrm{O}_{2}=1.5 \times 32=48 \mathrm{~g}$

| Section 5: From masses to balanced equations (HT) |  |
| :---: | :---: |
| $\text { Number of moles }=\frac{\text { mass }(g)}{M_{r}}$ | 1) 8.08 g of Potassium nitrate $\mathrm{KNO}_{3}$ was decomposed on heating to form 6.8 g of potassium nitrite $\mathrm{KNO}_{2}$ and 1.28 g of oxygen. <br> a) Calculate the number of moles of $\mathrm{KNO}_{3}, \mathrm{KNO}_{2}$ and $\mathrm{O}_{2}$ and hence <br> Moles $\mathrm{KNO}_{\mathbf{3}}=\mathbf{8 . 0 8 / 1 0 1}=0.08$ <br> Moles $\mathrm{KNO}_{2}=6.8 / 85=0.08$ <br> Moles $\mathrm{O}_{\mathbf{2}}=1.28 / 32=0.04$ <br> b) Use your answers to a) to work out the simplest whole number ratio of these values and use this to write a balanced equation for the reaction. $\begin{gathered} \text { Moles } \mathrm{KNO}_{3}: \mathrm{KNO}_{2}: \mathrm{O}_{2} \\ 0.08: 0.08: 0.04 \\ 2: 2: 1 \end{gathered}$ <br> Hence equation is $2 \mathrm{KNO}_{3} \rightarrow 2 \mathrm{KNO}_{2}+\mathrm{O}_{2}$ |

> | Section 7: Expressing concentrations $\left(\right.$ in $\left.\mathrm{g} / \mathrm{dm}^{3}\right)$ |
| :--- |
| If you are working in decimetres cubed $\left(\mathrm{dm}^{3}\right)$ |
| Concentration $\left(\mathrm{g} / \mathrm{dm}^{3}\right)=\frac{\text { mass of solute }(\mathrm{g})}{\text { volume }\left(\mathrm{dm}^{3}\right)}$ |
| If you are working in centimetres cubed $\left(\mathrm{cm}^{3}\right)$ |
| Concentration $\left(\mathrm{g} / \mathrm{dm}^{3}\right)=\frac{\text { mass of solute }(\mathrm{g}) \times 1000}{\text { volume }\left(\mathrm{cm}^{3}\right)}$ |

1) Calculate the concentration in $\mathrm{g} / \mathrm{dm}^{3}$ of 6 g of magnesium chloride dissolved in $1.5 \mathrm{dm}^{3}$ of solution
Concentration $=6 / 1.5=\mathbf{4} \mathbf{g} / \mathbf{d m}^{3}$
2) Calculate the concentration in $\mathrm{g} / \mathrm{dm}^{3}$ of 40 g of sodium hydroxide dissolved in $500 \mathrm{~cm}^{3}$ of solution
Concentration $=\mathbf{4 0} / \mathbf{5 0 0} \times \mathbf{1 0 0 0}=\mathbf{8 0} \mathbf{g} / \mathrm{dm}^{3}$

## Section 6: Limiting reactants (HT)

$$
\text { Number of moles }=\frac{\text { mass }(g)}{M_{r}}
$$

Remember:
A limiting reactant is the reactant that gets used up first in a chemical reaction. It limits the amount of product formed.

Excess reactant is the reactant that is not completely used up in a chemical reaction. There is some reactant left at the end.

1) If you have 7.2 g of magnesium reacting with 10.95 g of dilute hydrochloric acid, which reactant is in excess?

$$
\mathrm{Mg}_{(\mathrm{s})}+2 \mathrm{HCl}_{(\mathrm{aq})} \rightarrow \mathrm{MgCl}_{2(\mathrm{aq})}+\mathrm{H}_{2(\mathrm{~g})}
$$

Moles $\mathrm{Mg}=7.2 / 24=0.3 \mathrm{~mol}$
Moles $\mathrm{HCl}=10.95 / 36.5=0.3 \mathrm{~mol}$
From the balanced equation you see that 1 mole of $\mathbf{M g}$ reacts with 2 moles of HCl.
Hence 0.3 mol of $\mathbf{M g}$ requires 0.6 mol of $\mathbf{~ H C l}$ to react completely. We only have 0.3 mol of HCl so dilute hydrochloric acid is the limiting reactant.

## ORGANISER

| Section 8: Chemical calculations Key Terms (Triple) |  |
| :--- | :--- |
| Yield of a chemical <br> reaction | Describes how much product is made |
| Percentage yield | Tells you how much product is made compared <br> with the maximum amount that could be made. |
| Atom Economy | A measure of the amount of starting materials <br> that end up as useful products |
| Titration | Used to measure accurately what volumes of acid <br> and alkali react together completely. |
| Standard solution | A solution of known concentration. |

Section 9: The yield of a chemical reaction (Triple)
Number of moles $=\underline{\text { mass }(g)}$
$M_{r}$
Percentage yield $=$ actual yield of product produced $\times 100$ theoretical yield of product

1) A gas fired kiln produced 100 g of calcium oxide (CaO) from 200 g of Limestone $\left(\mathrm{CaCO}_{3}\right)$. What is the percentage yield of calcium oxide produced? $\quad \mathrm{CaCO}_{3} \rightarrow \mathrm{CaO}+\mathrm{CO}_{2}$

Moles of $\mathrm{CaCO}_{3}=\mathbf{2 0 0} / \mathbf{1 0 0}=\mathbf{2} \mathbf{~ m o l}$
For every 1 mol of $\mathrm{CaCO}_{3}$ we make 1 mol of CaO
Hence theoretical yield of $\mathbf{C a O}=2 \times 56 \mathrm{~g}=112 \mathrm{~g}$
Actual yield of $\mathbf{C a O}=\mathbf{1 0 0 g}$
Percentage yield $=100 / 112 \times 100=89.3 \%$
Factors affecting percentage yield

- Reaction may be reversible
- Some unwanted products may be formed
- Some of the desired product lost in handling/left on apparatus Reactants may be impure

## Section 10: Atom economy (Triple)

Percentage atom economy $=\underline{\text { relative formula mass of desired product } \times 100}$ sum of the relative formula masses of the reactants

1) Calculate the atom economy for the production of dichloromethane $\mathrm{CH}_{2} \mathrm{Cl}_{2}$.

$$
\mathrm{CH}_{4}+2 \mathrm{Cl}_{2} \rightarrow \mathrm{CH}_{2} \mathrm{Cl}_{2}+2 \mathrm{HCl}
$$

Relative formula mass desired product $\mathrm{CH}_{2} \mathrm{Cl}_{2}=12+2+(2 \times 35.5)=85$
Sum of relative formula mass of all reactants $=12+4+(2 \times 71)=158$
Percentage atom economy $=85 / 158 \times 100=53.8 \%$

## Section 11: Titrations (Triple)

A Volumetric pipette is used to measure out a fixed volume of solution
A burette is used to measure the volume of the solution added

## Steps for carrying out a titration

- Wash a volumetric pipette with distilled water followed by some of the alkali
- Measure a known volume of alkali into a conical flask using the pipette
- Add a few drops of indicator to the solution in the conical flask and swirl
- Place a white tile under the flask
- Rinse a burette with distilled water followed by some of the acid, allowing some of the acid to pass through the tap (filling the jet)
- Fill the burette up to the mark using the acid
- Record initial reading on the burette
- Open tap to slowly release acid into the conical flask whilst swirling
- Keep on repeating this until the indicator changes colour (end point)
- Record final volume reading on the burette by reading the bottom of the meniscus.
- Work out the volume of acid (titre) that was run into the flask
- Repeat the whole process at least three times until you get concordant

## titres

- Calculate the mean titre
- Use results to calculate concentration of the alkali in $\mathrm{mol} / \mathrm{dm}^{3}$

## Chemistry Topic 4 Chemical calculations (Triple)

## ORGANISER

[^0]
## Section 13 (cont): Titration calculations (Triple \& HT)

A student titrated hydrochloric acid with $0.10 \mathrm{~mol} / \mathrm{dm}^{3}$ sodium hydroxide solution. The method used is shown below:

- Pipette $25.0 \mathrm{~cm}^{3}$ of sodium hydroxide solution into a conical flask.
- Add a few drops of Phenolphthalein indicator to the sodium hydroxide solution.
- Add hydrochloric acid solution from a burette until the end-point is reached.

The table below shows the students results:

|  | Titre 1 | Titre 2 | Titre 3 | Titre 4 | Titre 5 |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Volume <br> $\mathrm{HCl} \mathrm{cm}^{3}$ | 13.60 | 12.10 | 11.10 | 12.15 | 12.15 |

1) Use concordant results in the table to calculate:
a) The mean titre
b) Concentration of the hydrochloric acid solution
a) Concordant results are those within $0.10 \mathrm{~cm}^{3}$ of each other.
Mean titre $=12.10+12.15+12.15=12.13$ Mean titre $=\frac{12.10+12.15+12.15}{3}=12.13$
b) Moles $\mathrm{NaOH}=\mathbf{0 . 1} \times 25 / 1000=0.0025$

Moles $\mathrm{HCl}=$ Moles $\mathrm{NaOH}=\mathbf{0 . 0 0 2 5}$
Concentration $\mathrm{HCl}=0.0025 \times 1000 / 12.13=0.206 \mathrm{~mol} / \mathrm{dm}^{3}$
The equation for the titration is: $\mathrm{HCl}_{(\mathrm{aq})}+\mathrm{NaOH}_{(\mathrm{aq)}} \rightarrow \mathrm{NaCl}_{(\mathrm{aq})}+\mathrm{H}_{2} \mathrm{O}_{(\mathrm{I})}$

1) Use concordant results in the table to calculate:
$\qquad$

Section 14: Volume of gases (Triple \& HT)
Number of moles of gas $=\frac{\text { volume of gas }\left(\mathrm{dm}^{3}\right)}{24 \mathrm{dm}^{3}}$ or volume of gas $\left(\mathrm{cm}^{3}\right)$
2) How many moles of gas are present in $48 \mathrm{dm}^{3}$ of $\mathrm{CO}_{2(\mathrm{~g})}$

Moles $=\mathbf{4 8} / \mathbf{2 4} \mathbf{=} \mathbf{2}$ moles
2) Calculate the volume of gas (in $\mathrm{cm}^{3}$ ) in 1.5 moles of $\mathrm{N}_{2} \mathrm{O}_{4}$

Volume $=1.5 \times 24000=36000 \mathrm{~cm}^{3}$

[^0]:    ## Section 13: Titration calculations (Triple \& HT)

    Concentration $\left(\mathrm{mol} / \mathrm{dm}^{3}\right)=$ number of moles $\times 1000$

    1) In a titration, $20 \mathrm{~cm}^{3}$ of $0.2 \mathrm{~mol} / \mathrm{dm}^{3} \mathrm{HCl}$ reacted with $50 \mathrm{~cm}^{3}$ of NaOH . Calculate the concentration of the sodium hydroxide.

    $$
    \mathrm{NaOH}+\mathrm{HCl} \rightarrow \mathrm{NaCl}+\mathrm{H}_{2} \mathrm{O}
    $$

    Moles $=$ Conc $\mathbf{x}$ vol/ 1000
    hence moles $\mathbf{H C l}=0.2 \times 20 / 1000=0.004 \mathbf{~ m o l}$
    Ratio of HCl : $\mathrm{NaOH} 1: 1$ hence moles of NaOH is 0.004 mol
    Concentration $\mathrm{NaOH}=0.004 \times 1000 / 50=0.08 \mathrm{~mol} / \mathrm{dm}^{3}$

    $$
    \text { volume }\left(\mathrm{cm}^{3}\right)
    $$

    $\mathrm{NaOH}+\mathrm{HCl} \rightarrow \mathrm{NaCl}+\mathrm{H}_{2} \mathrm{O}$
    Se
